**ACKNOWLEDGMENT:**

A student of university have to write the acknowledgment for their project or research paper stating that the submission is done and is not copied. The acknowledgment sample for the university project is mostly attached after the dedication page thanking all the faculty members of the department, HOD, The Dean and the mentor.

we would like to express our profound gratitude to Mr.Sivaprakash S for his contribution to the completion of our project titled Law Firm Archive.

We would like to acknowledge that this project was completed entirely by us and not by someone else.

**INTRODUCTION:**

As the world increasingly progresses towards a technology driven environment, the legal sector isn't to be left behind. In the past years, clients get to know about lawyers through recommendation and there would be no easy way to contact the lawyer and exchange information on a case other than direct contact. Work was slow and tedious as paperwork piled up and had to be marked and filed so that it could be referred later on.

In the past years, clients get to know about lawyers through recommendation and there would be no easy way to contact the lawyer and exchange information on a case other than direct contact. Work was slow and tedious as paperwork piled up and had to be marked and filed so that it could be referred later on. The basis of this project is to bridge the technology gap between the lawyers and clients in India.

### **PROBLEM DEFINITION:**

Since direct contact with the lawyer is needed by the client for every situation, the clients have to go all way to the lawyer's office. Lawyer needs to pile up huge case details in his office and these need to be maintained properly. Also, some people don't know what lawyers to choose for their cases. Sometimes people in remote village can't get access to the best lawyers for their cases. In this situation a trusted source is needed to guide them so that they can confidently win cases with the best lawyers. These problems are faced in the law domain.

### **PROJECT SCOPE:**

The basis of this project is to bridge the technology gap between the lawyers and clients in India. Firms that deal with legal services will most likely handle huge quantities of inventory and have to make sure that these files are readily available at a moment's notice. Records kept on paper in files are no longer feasible. Details of clients and employees, information on cases and hearings etc thus need a better mode of management. It has therefore become necessary for these firms to use a way which will securely handle this massive data and readily avail it to over one person at a time, quickly and instantly, even though they are in different locations. Our project "Law Firm Management Website" aims to provide the client and employees of a law firm with an easy to access, secure and direct means of accessing the resources of a law firm.

### **LITERATURE SURVEY:**

From the result of literature we came to know that though technology is the modern era tool to achieve anything. But it has not succeeded in every aspects. Because summarising the

surveys, there is not proper law firm management website or application. In India the E-court works with the help of Support Vector Machines (SVM). It only helps to solve small cases that too with the punishments associated with the Indian Penal Code Sessions. And there are some applications that collect the criminal cases depending upon the IPC entered and display it for analysis. But coming to the client lawyer management. The applications is not communication friendly. As it focuses only on the cases and combining multiple cases but not in improving the communication between the clients and the employees. So as a result we have created a application with an attempt to increase the communication between the client and lawyers.

**G. Xiaodong, "Research on the evaluation of influencing factors of knowledge management in law firm," 2011 International Conference on Product Innovation Management (ICPIM 2011), 2011, pp. 207-210, doi: 10.1109/ICPIM.2011.5983637.**

In order to evaluate the performance of law firm knowledge management, this research first examined the performance assessment index components. Next, it developed a multilevel fuzzy comprehensive evaluation model. Applications showed that this model overcame the weaknesses of qualitative assessment, whose subjectivity was too strong, and had good logic and validity, making it a useful instrument for assessing the effectiveness of knowledge management in legal firms.

The only way to improve the rigour of law companies' assessment, extend the information of law firms' evaluation findings, and raise the flexibility of evaluation system is to develop a complete evaluation index system of a law firm's knowledge management. The assessment approach eliminates the significant subjectivity of qualitative evaluation by providing quantitative findings of the knowledge management performance evaluation of law firms. The model is a useful tool for assessing the knowledge management capabilities of law firms.

**M. Singh, "Indian Judicial System Overview and a Approach for Automatic Roster Preparation and Case Scheduling for Faster Case Solving (Need of: E-Courts)," 2018 International Conference on Advances in Computing, Communication Control and Networking (ICACCCN), 2018, pp. 128-131, doi: 10.1109/ICACCCN.2018.8748721.**

A real democratic nation is supported by four main institutions: the executive branch of government, the legislature composed of the parliament and state legislatures, the media, and the judicial system.

The contributions of the four pillars are equally crucial for functioning democracies. To guarantee the freedom of its people and to uphold law and order in the nation, it is crucial that all four of these pillars operate in tandem, independently, and properly.

The judiciary is the most significant of the four pillars from the perspective of the general populace since it protects its citizens from the excesses of the executive and legislative branches.

The backlog of cases is one of the biggest issues facing the judiciary today. In order to improve the services offered by the court, a new project dubbed "E-Court" was launched in 2005. It allows for the electronic filing of cases, CM, case lists, judgement announcements, etc. Additionally, this initiative offers video conferencing, witnessing and live broadcasting of court proceedings.

In this study, we came to know an algorithm for automatic roster and cause list creation, drawing inspiration from the E-Court project. The suggested approach aids in the better roster and cause list construction by taking into account the judges' experience and the importance or priority of the cases. The algorithm leads to an improvement in the court's case-solving efficiency. I'm hoping that the suggested algorithm would help the court cope with the numerous cases that are now backlogged and the numerous cases that are being added every day. But this only helps in solving cases but the clients have to go meet the lawyers in person for each and every time. It does not create any ease for the citizens.

**A. Trivedi, A. Trivedi, S. Varshney, V. Joshipura, R. Mehta and J. Dhanani, "Extracted Summary Based Recommendation System for Indian Legal Documents," 2020 11th International Conference on Computing, Communication and Networking Technologies (ICCCNT), 2020, pp. 1-6, doi: 10.1109/ICCCNT49239.2020.9225290.**

Law professionals in a Common Law legal system are frequently entrusted with locating legal records related to the current case. However, Indian court paperwork are disorganised and lengthy. Finding a succinct, summarised version of the argument is therefore a challenging undertaking. In order to find the case document's paragraphs that contribute to its summary and utilise them to find additional papers that are comparable, this research suggests a unique approach. To do this, a Support Vector Classifier was trained using a dataset of carefully labelled summary paragraphs of Indian Supreme Court records from before the 1970s. The model covered in this research has shown encouraging outcomes with good accuracy.

**R. Sil and A. Roy, "A Novel Approach on Argument based Legal Prediction Model using Machine Learning," 2020 International Conference on Smart Electronics and Communication (ICOSEC), 2020, pp. 487-490, doi: 10.1109/ICOSEC49089.2020.9215310.**

Numerous lawsuits are still waiting every year merely to hear the ultimate judgement. While the complainant waits for justice, years go by. This has been a significant problem for the Indian court system for many years. By reducing the number of cases that must be resolved before they may be heard by the Court, the authors of this report have tried to streamline the issue. This is accomplished by giving legal experts assistance in making predictions about case outcomes based on historical data. This essay concentrates on situations involving "Dowry Death," specifically IPC sections 498A and 304B. It seeks to uphold justice by forecasting court argument-based analysis and determining its correctness using the Support Vector Machine (SVM) method.

The following stages are taken by this model: I From West Bengal's trial courts, hard copies of case files containing declared dowry judgements are gathered. (ii) Data sets are manually constructed depending on criteria such as (a) "Victim Name." (b) "Number of years married, whether or not longer than seven years." These criteria identify the crucial elements in "Dowry"-related cases in India. The case is a "dowry case" if it is filed within seven years after marriage and the defendant has taken dowry; otherwise, it is not.

"Dowry taken within seven years of marriage (Yes/No)" is item (c). The parameter (d) "Incident happened within seven years of marriage" indicates that if a death occurs within seven years of a marriage, it is considered a "Dowry Death" case.(e) "Postmortem Report (Usual/Unusual Death)," as well as several other specified criteria. A Controlled Machine Learning (iii)Support Vector Machine (SVM), an algorithm, is employed as a prediction system to aid in the administration of justice. Using a supervised learning technique, this research seeks to predict a person's guilt or innocence. The study illustrates the model's efficiency and precision using a common classifier, the Support Vector Machine (SVM).This helps in solving very small cases that require minimal evidence. But it does not support the communication between the client and the lawyers.

**D. Gaur, "Data mining and visualization on legal documents," 2011 International Conference on Recent Trends in Information Systems, 2011, pp. 132-136, doi: 10.1109/ReTIS.2011.6146854.**

A system called LIRFSS (Legal Information Retrieval and Focused Semantic Search) performs information retrieval (IR) and information extraction (IE) on decisions made by the Indian Supreme Court, specifically on murder-related criminal cases, and provides results for focused semantic searches. This system has a high potential to help judges, attorneys, and citizens gain access to the law. This document discusses the LIRFSS development process. A sample set of papers was used to identify the appropriate information to be collected for criminal cases, such as the date, place of the incident, and IPC (Indian Penal code)[1] sections.

To make the most of the publicly accessible legislation on the internet, better tools are needed than manual browsing and other search methods. As a consequence, a semantic search is conducted using extracted information, and the most relevant instances were returned as a result. Information visualisation is used in this study along with a novel hypothesis that is developed and tested as the analysis of the enormous amounts of data gets more challenging. 20 training manuals were used, and a respectable level of accuracy was attained. So, this paper helps in analyzing the recently occurred cases but not any solution providing features or any client-lawyer communication oriented features.

## **MOTIVATION:**

The main motivation behind this project is for the people in India to find the lawyers so that they can keep in touch with the best lawyers no matter where they are. Even though people in remote area can get in touch with the best lawyers in the country. Here the requirements needed for the users are only the internet and a mobile phone or a laptop. And coming to the lawyers, their office is always piled up with lots of documents and is very difficult to maintain. This is a small approach to reduce that.

## **EXISTING SYSTEM:**

### **MyCase**

MyCase is a comprehensive case management programme with features including email, calendaring, invoicing, and contact management. The software is intended to encourage better productivity and assist small to medium law firms in managing their business from a single, user-friendly dashboard.

MyCase enables attorneys to seamlessly exchange documents, work on the move, and improve the client experience via a web, mobile, and client interface.

### **Practice Panther**

PracticePanther is a legal practice management system with a focus on automation, time-tracking, billing, and case administration. The programme is meant to assist legal teams with case management and preparation, document organisation and tracking, and payment management.

PracticePanther also connects with other beneficial applications that may streamline your practice and enhance your attempts at business development, like MailChimp, Dropbox, Zapier, and more.

### **Smoke Ball**

Legal teams may enhance their billing while fostering client happiness with Smokeball, a legal case management tool that blends productivity benefits with automatic time monitoring.

You can manage all client interactions, e-signatures, billing, legal document automation, and more with Smokeball. Smokeball's client portal and mobile app assist lawyers in giving clients a smooth experience.

### **DRAWBACKS OF EXISTING SYSTEM:**

- ☐ Problems are experienced in the billing section and very expensive
- ☐ The biggest drawback is that there are lots of features in this software that makes it difficult to use at first.
- ☐ The lack of one drive integration is missing. Document uploading is mismanaged.
- ☐ One drive integration is to make it easy to share files with your ProWorkflow users
- ☐ Very time consuming and not realistic

### **ADVANTAGES OF PROPOSED SYSTEM:**

- ☐ The clients can submit the case details, lawyers will be appointed by the admins.
- ☐ User friendly application as the client need not know what to do to find their case details.
- ☐ Once they login they can get their case details.
- ☐ One drive integration can be done. A group of co-working lawyers can access the files and update the case details.

### **REQUIREMENTS ENGINEERING:**

#### **Functional Requirements:**

- The lawyers list should be properly available for the clients to view and select.
- The documents should be uploaded precisely by lawyers based on the case details given by the client.
- The client will be able to give the case details only after the payment of the fee.
- Hearing date and documents for hearing should be given by the documents clearly.
- System should allow the partner to update additional information to the document regarding the case.

- The system should be made available for the partners to access their employee information.

### **Non Functional Requirements:**

#### **Performance Requirements**

- Response Time: The response time should be <3.5 second which is the average response time for any website.
- Workload: The workload time should be <3.21 seconds which is the average workload.
- Scalability: The software should be created keeping in the mind the scalability. As the users increase, the load will also increase.
- Platform: An underlying hardware and software as specified in the hardware and software requirements is needed.

#### **Safety Requirements**

Since the data flow is happening in the server , there shouldn't be any disruption in the dataflow happening in the server. Proper electricity and backup is required for the server.

#### **Security Requirements**

Since the documents involve confidential case details. A trustable person is required to handle the software.

#### **Software Quality Attributes**

1)Reliability: The software needs to be easy to use for both the users and mainly for the clients to easily view their case details.

2)Portability: The main idea for the development of the software is for portability. So the clients and partners can access the data from anywhere in the world.

3)Usability: The software needs to provide an easy user experience for the client and partner who accesses it. Therefore, it should be easy to use.

4)Efficiency: Since the software stores data in large amounts. The software should be easy and of quick access.

### Business Rules

The clients can only view the number of cases, hearing dates, and information related to their cases. They are not involved in the modification of the data present. The power to modify the data can be only done by the partners (Lawyers).

### DIAGRAMS:

#### Flow Diagram:

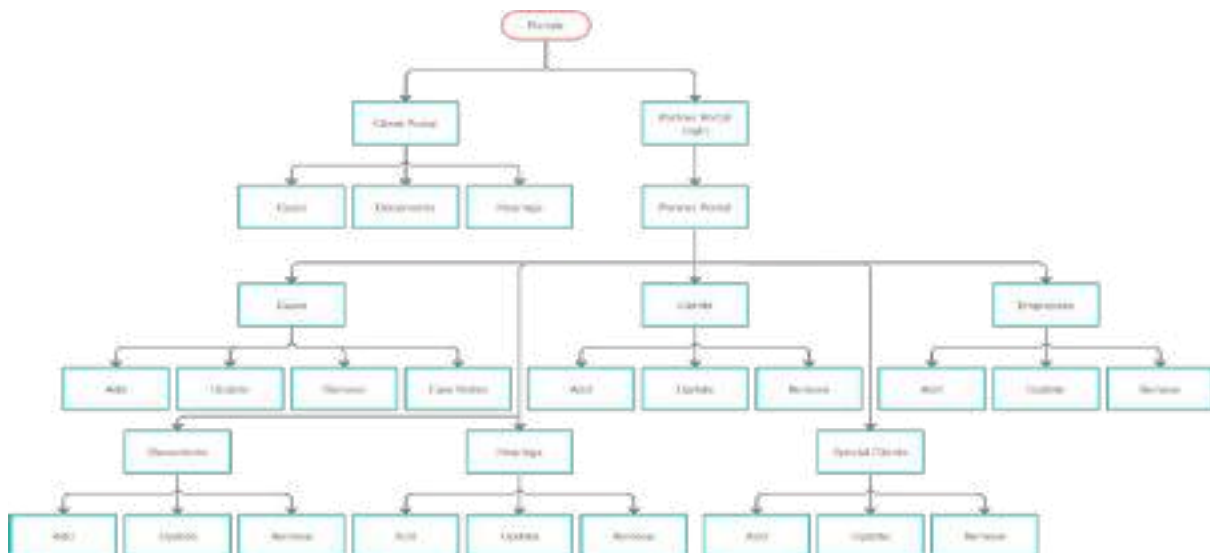

Fig 1

#### Work breakdown structure:

The work breakdown structure of our project is as follows:

It is divided into 5 main parts:

1. Project management
2. Design Team
3. Frontend
4. Backend
5. Web Application

Each of these parts has a list of tasks/features that must be implemented by us. It breaks down the project into its subparts which we can focus on one at a time and make in increments.

Our vision for the website includes a home page, register and log in page, client portal, admin portal and employee portal.

Fig 2

### Use Case Diagram:

A use case diagram contains four components:

- The boundary, which defines the system of interest in relation to the world around it.
- The actors, usually individuals involved with the system defined according to their roles.
- The use cases, which are the specific roles played by the actors within and around the system.
- The relationships between and among the actors and the use cases.

The actors can be human users, some internal applications or may be some external applications.

So, in a brief when we are planning to draw a use case diagram we should have the following

items identified.

i. Functionalities to be represented as an use case

ii. Actors

iii. Relationships among the use cases and actors.

Use case diagrams are drawn to capture the functional requirements of a system.

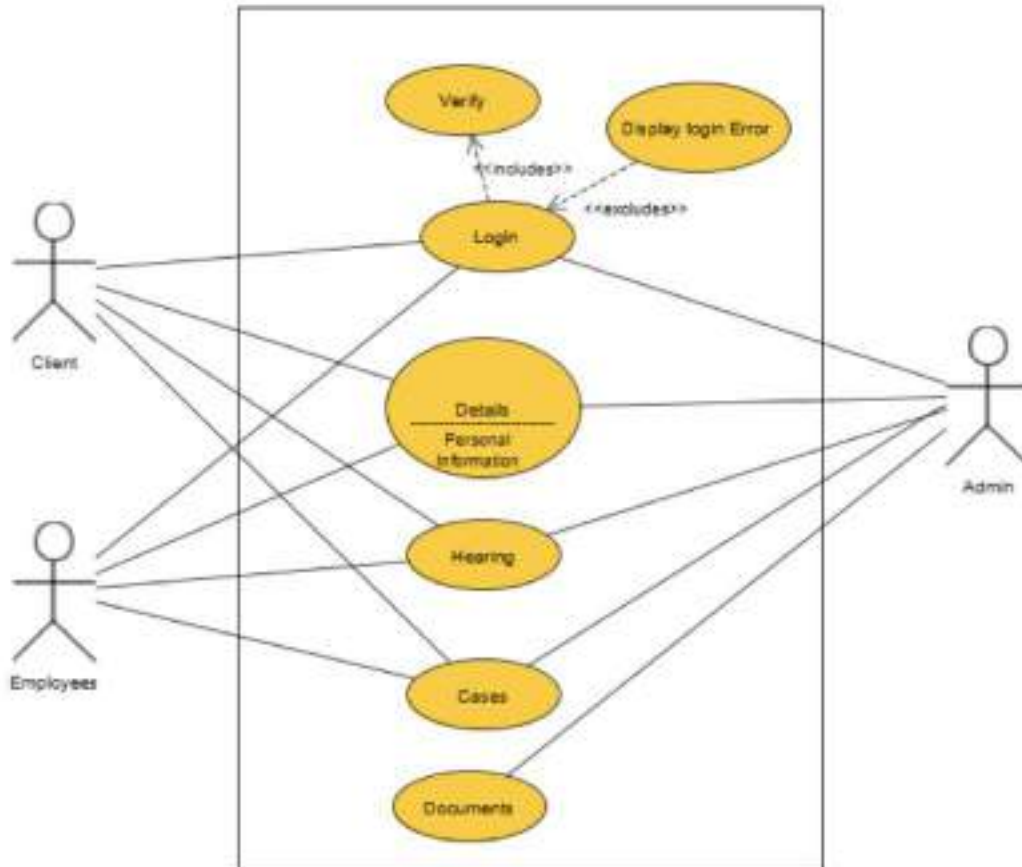

Fig 3

- ☐ The three actors in the above Use Case diagram are Client, Admin and Lawyer. Here, the client and employee are the primary actors and the admin is the secondary actor.
- ☐ Here the client, employee and admin all three users login and verification of the credentials comes under the label <<include>> and the display login error for the incorrect credentials entered under the label<<exclude>>.
- ☐ The primary actor's client and the employee can view the case details, hearing,court and personal information whereas the admin can modify the data entered.

### Class Diagram:

Class diagram is a static diagram. It represents the static view of our application. It is not only used for visualizing, describing, and documenting different aspects of a system but also for constructing executable code of the software application. It describes the attributes and the operation of a class and the constraints imposed on the system. It is widely used in the modelling of object-oriented systems because they are the only UML diagrams, which can be mapped directly with object-oriented languages.

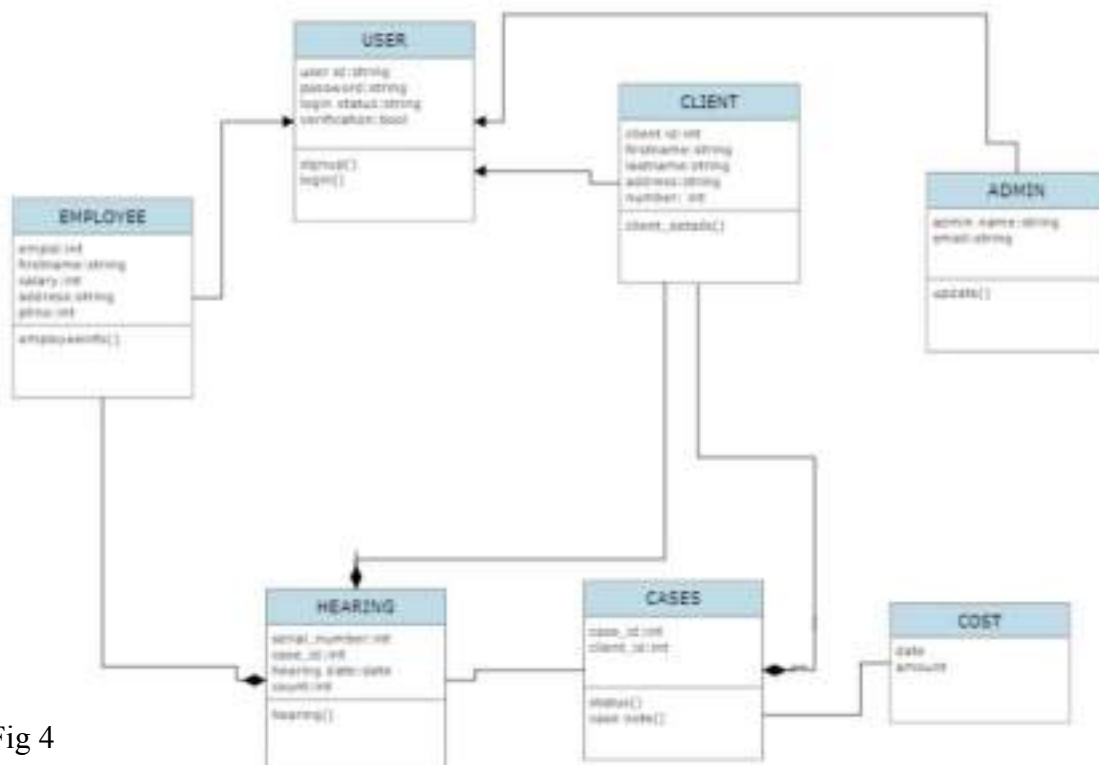

Fig 4

### Sequence Diagram:

Sequence diagram for case management

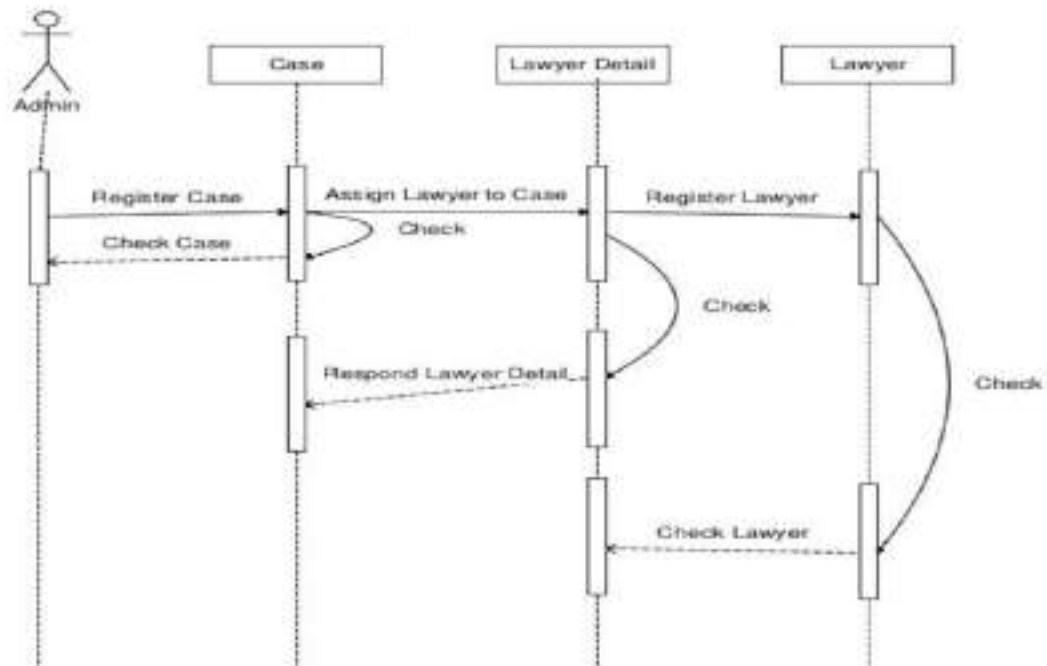

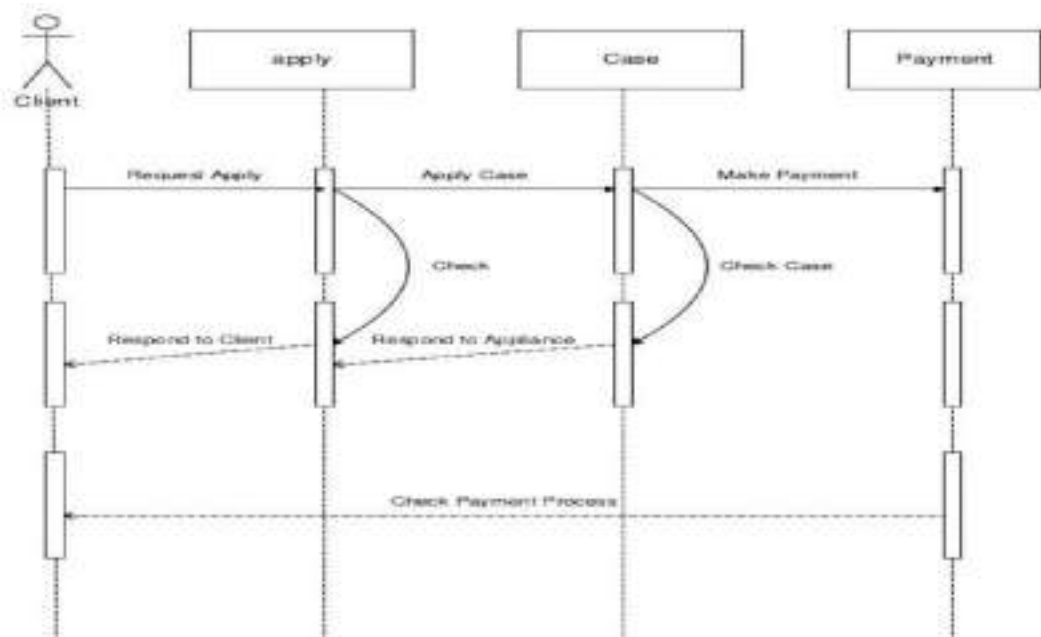

Fig 5.1

Sequence diagram for case apply

**MODULES AND CONTRIBUTION:**

- ☐ Authentication- Sunil B (20BCE2270)
- ☐ Client-Rithik RR (20BDS0201)
- ☐ Employee/Lawyer- Reahan SK (20BCE2300)
- ☐ Admin- Naveen Chittala (20BCE0383) and Rakesh B (20BCE2792)

**MODULES DESCRIPTION:****1. Authentication**

There are authentication for three types of user i.e., client, lawyers, admin. The clients, lawyers and admin can use the application only if the credentials entered matches the data stored in the database.

**2. Client**

Here the clients can login via username and password. Here the client should send his documents related to his case to the admin and then the admin will check them and upload. The clients can get to know the hearing details, the situation or the status of the present case they are dealing with.

**3. Employee or lawyers**

Here the lawyers can get to know the clients after the clients have chosen them. Lawyers can see hearings, when it happens in court. Once the admin uploaded the documents Employee or lawyer will see documents related to his client.

**4. Admin**

Here the admin is the one who manages the overall application. They take care of all the documents uploaded by the clients and the documents or the case standing, and lawyers working under them.

The screenshot displays the eLitigation portal interface. At the top, there is a navigation menu with tabs: Cases, Hearings, Employees, Documents, Courts, and Cases. Below this, a table lists documents with columns: Case ID, Document ID, Document Name, Authenticity, and File. The table contains four rows of data. Below the table is an 'Add' button. The background of the interface features a blurred image of a courtroom, with a judge's gavel visible on the left and a scale of justice on the right.

                    </body>
                    <script>

                        </script>
                </html>

```

## RESULT:

Here the clients can get in this with the lawyers they want by selecting them based on their experiences and can submit their case details via the admin. Now they can view the details of the case, hearing date, and court from the dashboard. Employees can register themselves in the application via the admin once they are part of the application. They can view the case clients, documents, and hearings, and that can be updated by informing the admin. Now, the

admin has the prime power to update the case details, like documents upload, case related modifications as told by the employee. Admin is given the power to modify rather than an employee in order to maintain confidentiality.

## **CONCLUSION:**

Law and order is very much important to develop and maintain the status of a country especially when it is a developing country like India. It maintains society's operations. Without law, there would be anarchy, survival of the fittest, and man against man. Most of the time, not the best way of life. The law is significant because it serves as a standard for what is permitted in society. Conflicts between social groups and communities would exist without it. So, this application was developed with an attempt to make law available to people and intermediates(lawyers) who fight for the rights of the citizens communicate with each other where ever they are.
